AM/FM STEREO RECEIVER

SX-1280

SERVICE MANUAL

PIONEER

MODEL SX-1280 COMES IN FOUR VERSIONS DISTINGUISHED AS FOLLOWS:

Type	Voltage	Remarks
KU	120V only	U.S.A. model
KC	120V only	Canada model
S	110V, 120V, 220V and 240V (Switchable)	General export model
S/G	110V, 120V, 220V and 240V (Switchable)	U.S. Military model

NOTICE:
- This service manual is applicable to the KU and KC types
- As to the S and S/G types, please refer to page 81.

Power Amplifier Section

Continuous power output of 185 watts* per channel, min., at 8 ohms from 20 Hertz to 20,000 Hertz with no more than 0.03% total harmonic distortion.

Total Harmonic Distortion (20 Hertz to 20,000 Hertz)
- Continuous Rated Power Output . .No more than 0.03%
- 90 watts per channel power output, 8 ohms . . . . . No more than 0.01%
- 1 watt per channel power output, 8 ohms . . . . . No more than 0.01%

Intermodulation Distortion (50 Hertz: 7,000 Hertz = 4:1)
- Continuous Rated Power Output . .No more than 0.01%
- 90 watts per channel power output, 8 ohms . . . . . No more than 0.006%
- 1 watt per channel power output, 8 ohms . . . . . No more than 0.005%

Frequency Response . . . . . 5 Hertz to 10,000 Hertz $^{+0}_{-1}$ dB
Input Sensitivity/Impedance
- POWER AMP IN . . . . . 1V/50 kilohms

Output
- SPEAKERS . . . . . A, B, C, A+B, B+C, C+A

Damping Factor
- (20 Hertz to 20,000 Hertz, 8 ohms) 30

Hum and Noise (IHF, short-circuited, A Network) . . 105dB

Preamplifier Section

Input (Sensitivity/Impedance)
- PHONO 1 . . . . . 2.5mV/50 kilohms
- Cartridge load (capacitance) . . . 100, 200, 300, 400pF
- PHONO 2 . . . . . 2.5mV/50 kilohms
- MIC . . . . . 7.5mV/50 kilohms
- AUX . . . . . 150mV/50 kilohms
- TAPE PLAY 1 . . . . . 150mV/50 kilohms
- TAPE PLAY 2 . . . . . 150mV/50 kilohms

PHONO Overload Level (1kHz; T.H.D: 0.03%)
- PHONO 1, 2 . . . . . 300mV

Output Level/Impedance
- TAPE REC 1 . . . . . 150mV
- TAPE REC 2 . . . . . 150mV
- PRE OUT . . . . . 1V/1 kilohms

Total Harmonic Distortion
- (20Hz to 20,000Hz, 1V output) . . .No more than 0.01%

Frequency Response
- PHONO (RIAA equalization) . 20Hz to 20,000Hz ±0.2dB
- AUX, TAPE PLAY . . . . . 5Hz to 80,000Hz $^{+0}_{-1}$ dB

Tone Control
- BASS . . . . . ±10dB (100Hz) main control, ±5dB (50Hz) sub control
- TREBLE . . . . . ±10dB (10kHz) main control, ±5dB (20kHz) sub control

Filter
- LOW 15Hz (12dB/oct.)
- HIGH 8kHz (12dB/oct.)

Loudness Contour (Volume control set at −40dB position) . . . . +6dB (100Hz), +3dB (10kHz)
Hum and Noise
- (IHF, short-circuited, A Network)
- PHONO 80dB
- AUX, TAPE PLAY 95dB

Muting . . . . . −20dB

FM Tuner Section

Usable Sensitivity
- MONO 9.8dBf (1.7μV)

50dB Quieting Sensitivity
- MONO 14.2dBf (2.8μV)
- STEREO 36dBf (34μV)

Signal-to-Noise Ratio
- (at 75dBf) . . .STEREO 74dB
- (at 65dBf) . . .MONO 80dB
- STEREO 71dB

Distortion (at 65dBf)
- 100Hz MONO/STEREO 0.1%/0.2%
- 1kHz MONO/STEREO 0.1%/0.15%
- 6kHz MONO/STEREO 0.1%/0.2%

Frequency Response . . . . . 30Hz to 15,000Hz $^{+0.2}_{-0.5}$ dB
Capture Ratio 1.0dB
Alternate Channel Selectivity 80dB
Spurious Response Ratio 100dB
Image Response Ratio 90dB
IF Response Ratio 110dB
AM Suppression Ratio 55dB
Muting Threshold 19.2dBf (5μV)
Stereo Separation . . . 50dB (1kHz), 35dB (30Hz – 15kHz)
Subcarrier Product Ratio 65dB
SCA Rejection Ratio 65dB
Antenna Input . . . . . 300 ohms balanced, 75 ohms unbalanced

AM Tuner Section

Sensitivity (IHF, Ferrite antenna) 300μV/m
(IHF, Ext. antenna) 15μV
Selectivity 30dB
Signal-to-Noise Ratio 50dB
Image Response Ratio 40dB
IF Response Ratio 40dB
Antenna . . . . . Built-in Ferrite Loopstick Antenna

Miscellaneous

Power Requirements 120V 60Hz
Power Consumption . . . . . 430W (UL), 1000VA (CSA)
1100W (max.)
Dimensions . . . . . 556(W) x 186(H) x 461(D) mm
21-11/16(W) x 6-15/16(H) x 17-5/16(D) in
Weight Without Package 28.7kg (63lb 3oz)
With Package 32.1kg (70lb 10oz)

Furnished Parts

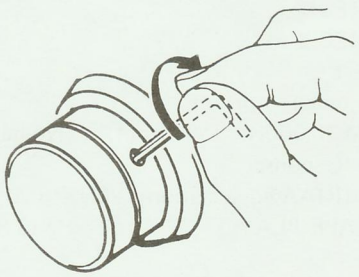
FM T-type Antenna 1
Operating Instructions 1
Hex. Wrench 1

**Measured pursuant to the Federal Trade Commission's Trade Regulation rule on Power Output Claims for Amplifiers.*

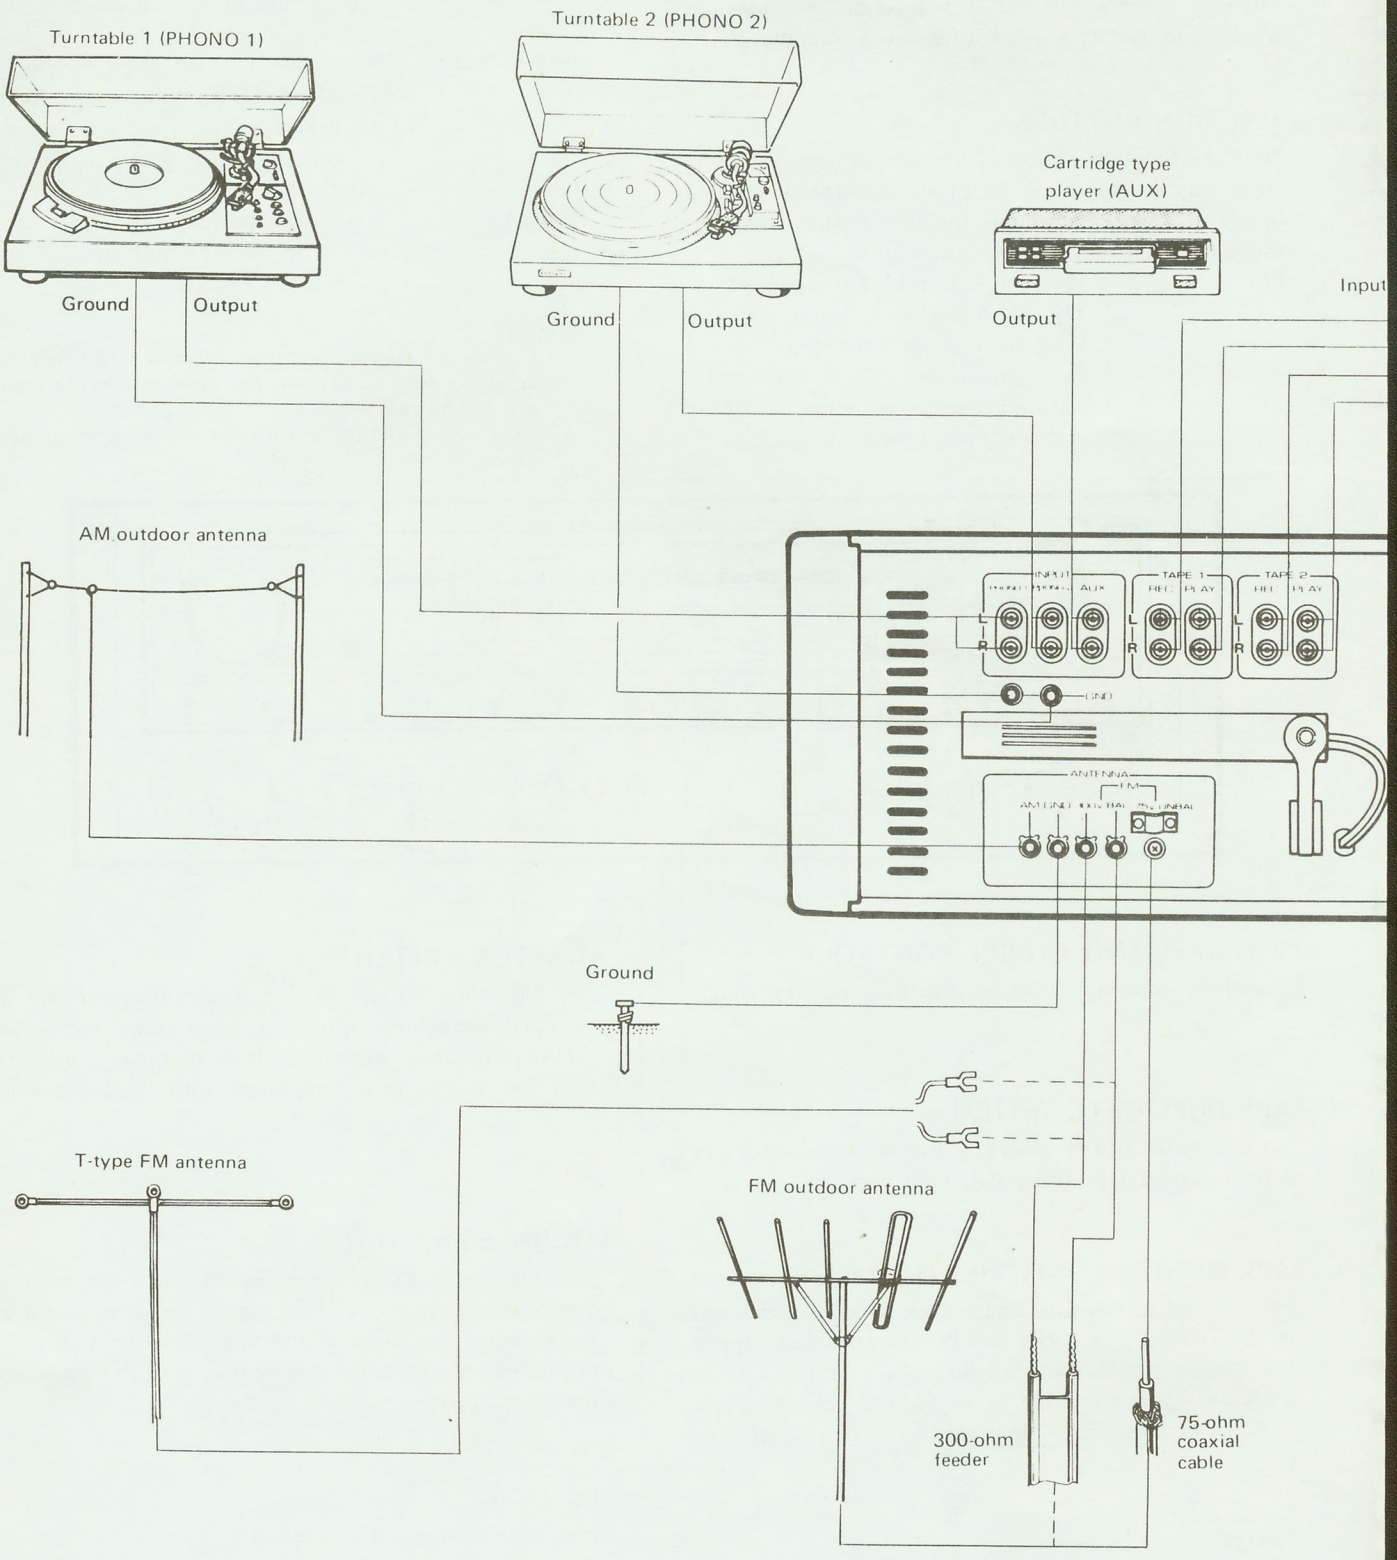
NOTE:
Specifications and the design subject to possible modification without notice due to improvements.

HEX. WRENCH

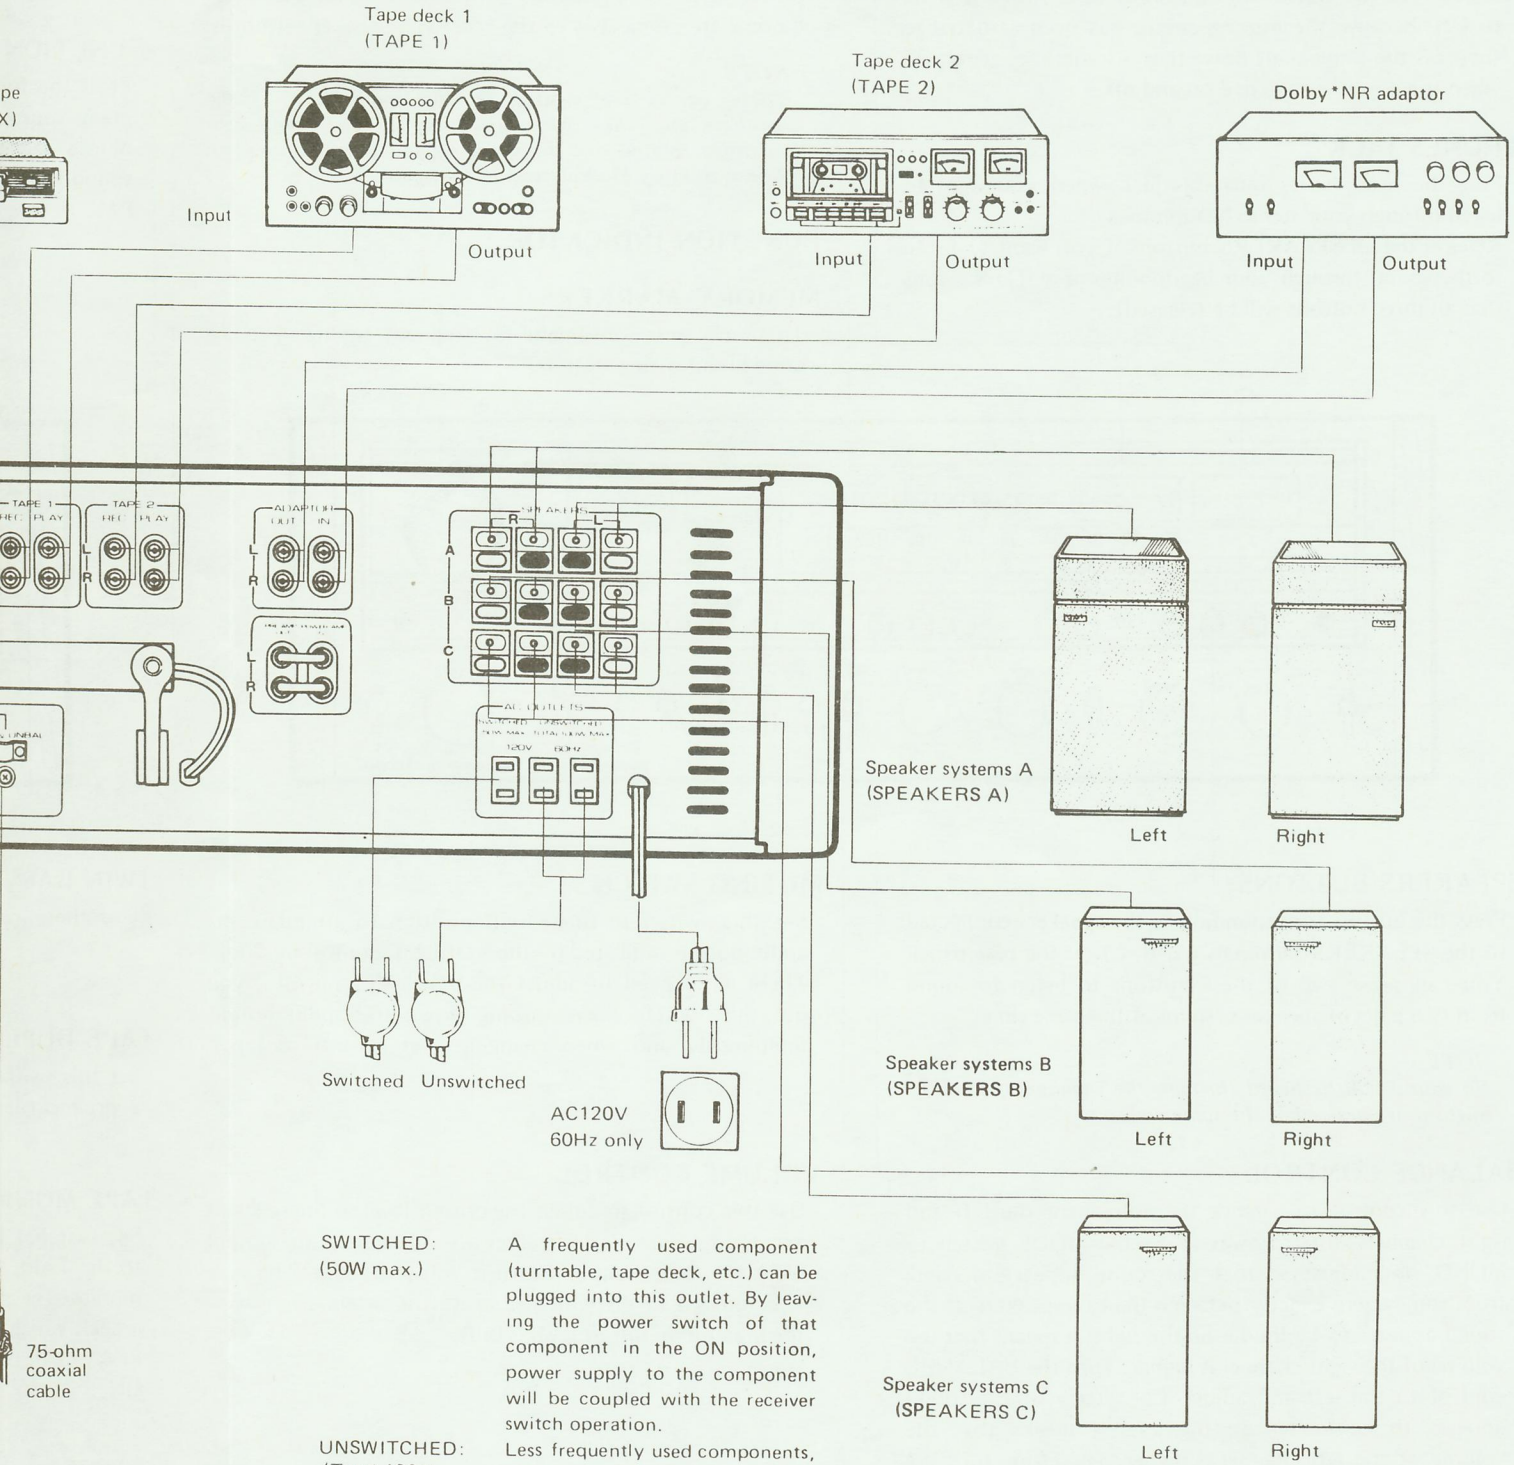
The accessory hexagonal wrench is provided for removing the TUNING knob and VOLUME knob or tightening their set screws should they become loose.
If required, loosen the set screw by inserting the wrench into the hole on the side of the knob and turning the wrench counter-clockwise. Be particularly careful not to scratch the front panel when employing the wrench.



2. CONNECTION DIAGRAM



Connect the power plug to the wall outlet because this receiver requires a lot of power.



SWITCHED: (50W max.) A frequently used component (turntable, tape deck, etc.) can be plugged into this outlet. By leaving the power switch of that component in the ON position, power supply to the component will be coupled with the receiver switch operation.

UNSWITCHED: (Total 100W max.) Less frequently used components, which do not require coupled power, can be plugged into either of these outlets.

* The word "Dolby" is a trademark of Dolby Laboratories Inc.

3. FRONT PANEL FACILITIES

POWER SWITCH

Flip this switch to the ON position to supply power to the stereo receiver. There will be a short delay when it is set to ON, because the muting circuit has been actuated to suppress the unpleasant noise that is sometimes generated when the power is switched on and off.

PHONES JACK

Plug the headphones into this jack when you want to listen through your stereo headphones.
Release the all SPEAKERS buttons if you want to listen to the sound through your headphones only (This means that all three buttons will be released).

POWER METERS

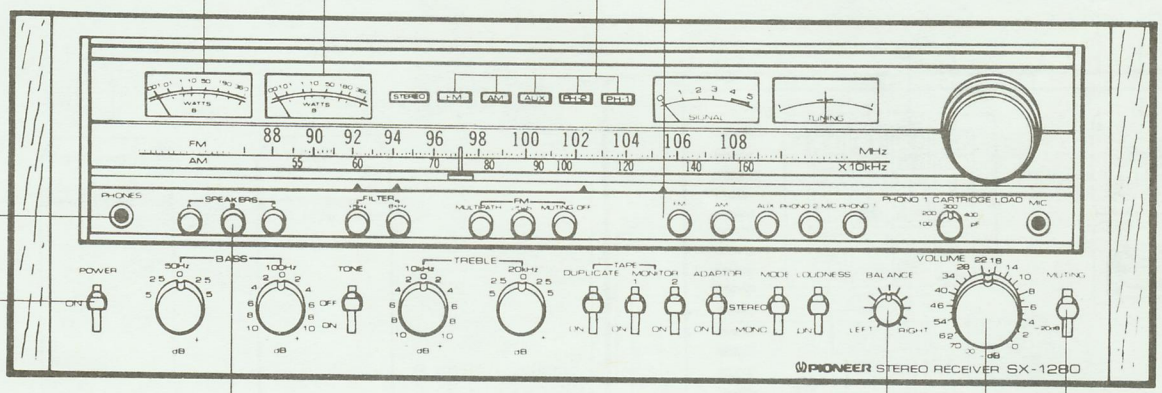
These power meters allow you to read out the rated power level when speakers with a nominal impedance of 8 ohms are connected to the receiver's speaker terminals.

NOTE:
These values are related to the impedance of the speakers and they vary according to the frequency. In order to find out the exact output level, connect an 8-ohm dummy load instead of the speakers.

FUNCTION INDICATOR

MEMORY MARKERS

These are very convenient for frequent tuning in to the same broadcasting station.



SPEAKERS BUTTONS

Press the button corresponding to the speakers connected to the SPEAKERS terminals (A, B, C) on the rear panel. You can press two of these buttons to listen to sound from two pairs of speaker systems at the same time.

NOTE:
No sound will be heard through the speakers if all three buttons are pressed at the same time.

BALANCE CONTROL

Use this control to balance the volume of the left and right channels. First, however, set the MODE switch to MONO, and adjust so that the sound appears to come from somewhere exactly between the two speakers. If the sound appears to be louder on the right, it means that the volume of the right channel is higher. Turn the BALANCE control to the left and adjust. Conversely, if the sound appears to be louder on the left, it means that the volume of the left channel is higher. Therefore, turn the BALANCE control to the right and adjust. After adjusting, return the MODE switch to STEREO.

MUTING SWITCH

Set this switch to the −20dB position to attenuate the audio output indicated by the VOLUME control by 20dB. There is no need to adjust the VOLUME control if you use this switch when turning down the audio output temporarily and when changing over records or tapes.

VOLUME CONTROL

Use this control to adjust the output level to the speakers and headphones. Turn it clockwise to increase the output level. No sound will be heard if you set it to ∞. The scale is graduated in dB which indicate the attenuation when the maximum output level is 0dB.

TONE SWITCH

Set this switch to ON when adjusting the BASS and TREBLE controls. In the OFF position, it causes the amplifier to operate with a flat frequency response.

FUNCTION BUTTONS

Press the function button which corresponds to the program source. Turn the VOLUME control down first before selecting a different function button while the sound from one program source is being reproduced.

FM . . . . . Press this button for FM broadcasts. The FM STEREO indicator lights up when the receiver is tuned in to an FM stereo broadcast. The sound is automatically received monophonically during FM monophonic broadcasts.

AM . . . . . Press this button for AM broadcasts.

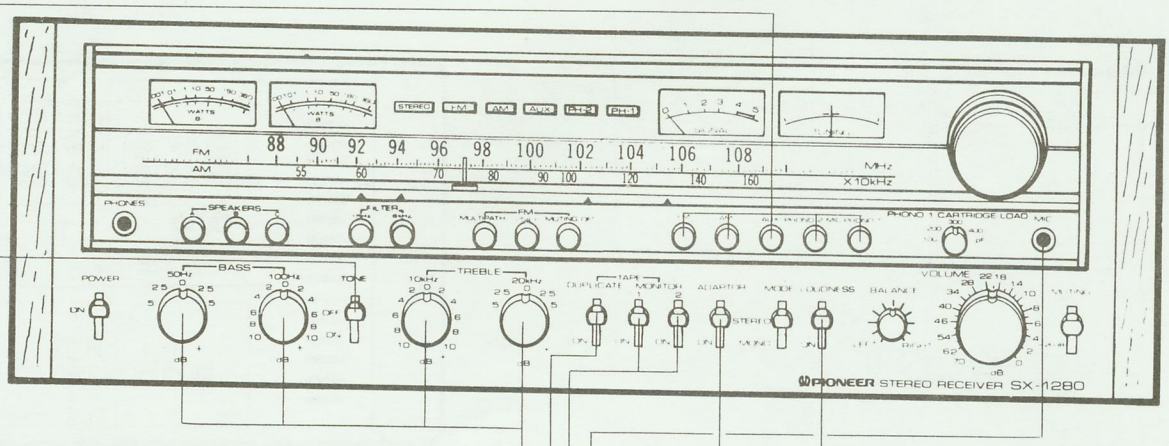
AUX . . . . . Press this button when listening to an audio component connected to the AUX input jacks.

PHONO 2/MIC . . Press this button when playing a record on the turntable connected to the PHONO 2 jacks, or when using a microphone which you have plugged into the MIC jack.

PHONO 1 . . . . . Press this button when playing a record on the turntable connected to the PHONO 1 jacks.

NOTES:

1. *Unplug the microphone from the MIC jack when you do not intend to use the microphone otherwise you will not be able to use the PHONO 2 jacks.*
2. *Only one function button should be pressed at a time.*



TWIN BASS AND TREBLE CONTROLS

Use these controls to adjust the bass and the treble.

TAPE DUPLICATE SWITCH

Set this switch to ON when you want to duplicate or edit a pre-recorded tape using two tape decks.

TAPE MONITOR SWITCHES (1, 2)

Set switch 1 to ON with a tape deck which is connected to the TAPE 1 jacks (REC and PLAY) when you want to monitor the playback or recording of a tape. The tape on a deck which is connected to the TAPE 2 jacks (REC and PLAY) can be similarly monitored by setting switch 2 to ON.

NOTE:
Set these switches to the upper (off) position when listening to records or a broadcast.

ADAPTOR SWITCH

Set this switch to ON when reproducing sound from an optional component which has been connected to the ADAPTOR jacks. Always set it to its upper position if you are not using a component with these terminals.

LOUDNESS SWITCH

Set this switch to ON when listening at a low volume. The frequency response of the human ear varies according to the listening volume, and setting this switch to the ON position compensates for hearing response by emphasizing the bass and treble.

MIC JACK

Plug your microphone into this jack.
The microphone signals are reproduced in mono through the left and right speakers.

TUNING METER

When tuning in to an FM station, the optimum reception position is indicated when the meter pointer deflects to dead center. Check that the SIGNAL meter pointer has deflected as far to the right as possible.

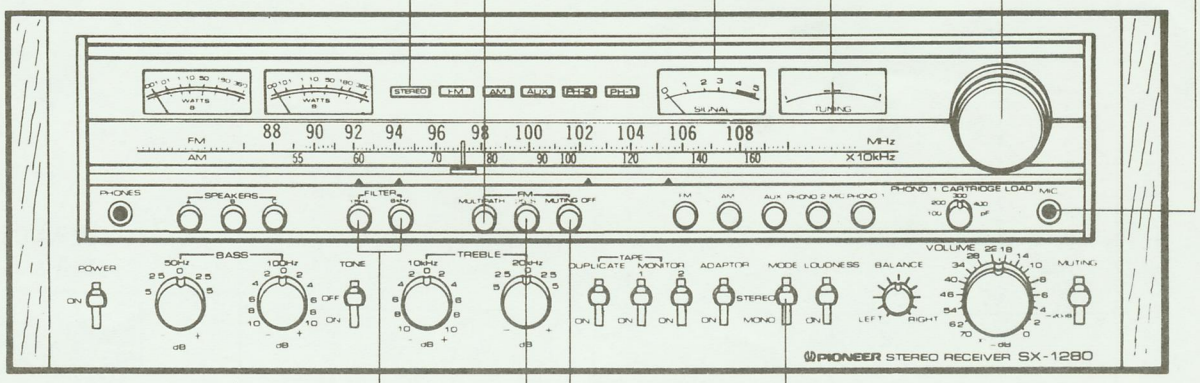
SIGNAL METER

When tuning in to an AM or FM station, the optimum reception position is indicated by the maximum deflection of the meter pointer to the right.

FM MULTIPATH BUTTON

Use this switch to detect multipath sound when installing the FM antenna in a position which yields the minimum multipath interference.

STEREO INDICATOR



PHONO 1 CARTRIDGE LOAD SWITCH

Use this knob to select the input capacitance (pF) in accordance with the specified load capacitance of the moving magnet (MM) cartridge connected to the PHONO 1 jacks.

TUNING KNOB

Use this to tune in to broadcasting stations.
Select the station and tune for optimum reception by observing the SIGNAL meter for AM stations and both the SIGNAL and TUNING meters for FM stations.

FILTER BUTTONS

15Hz . . When this button is pressed, a 12dB/oct attenuation can be provided for frequencies below 15Hz. This means that you can cancel out noise in the ultra-low frequencies which is generated by low-pitched rumble from a turntable and other forms of distortion. Although this noise cannot be heard, it can generate intermodulation distortion.

8kHz . . Press this button to provide a 12dB/oct attenuation at frequencies above 8kHz. Set it to this position when you find high-frequency noise, such as that from scratched records, unpleasant.

FM 25μs BUTTON

Press this button when listening to a *Dolby FM broadcast; otherwise keep this button at the released position.

MODE SWITCH

Use this switch for selecting mono or stereo performances.

STEREO: Set to this position for normal stereo operation.

MONO: When set to this position, the left and right channel signals will be mixed and reproduced monophonically from both speaker systems.

FM MUTING BUTTON

ON (released position) . . . Release this button to suppress unpleasant inter-station noise when tuning in to FM stations.

OFF (depressed position) . Depress this button to pick up weak stations.

6. CIRCUIT DESCRIPTIONS

Refer to the block diagram on page 11 and the schematic on page 43 for the circuit composition of this unit.

6.1 TUNER SECTION

AM Tuner

The AM tuner employs a 2-gang variable capacitor, one IC (HA1197) and one AM ceramic filter. Its block diagram is given in Fig. 1.

HA1197 is an IC containing an RF amplifier, converter, 2-stage IF amplifier, detector, and AGC circuit, and features excellent AF frequency response and distortion. Q_1 of the output circuit is a special AM muting circuit. This circuit is operated until the AM tuner stabilizes immediately after the FUNCTION AM switch has been set to ON. The instant the AM switch is set to ON, +B is supplied to R_8, thru C_9, and the base of Q_1 is forward biased.

Consequently, Q_1 is turned ON, and the AM output signal is shorted to ground during the time constant of C_9, R_8.

FM Front End

The FM front end employs a 4-gang variable capacitor in the tuning circuit, dual gate MOS FETs at the RF amplifier and mixer, and a local oscillator with J-FET buffer.

The FM front-end input is 75Ω unbalanced single-tuned circuit. The RF amplifier is a dual gate MOS FET. An M-coupled double-tuned circuit is inserted between stages. The dual gate FET is an amplifying element suitable for RF circuits, and features extremely stable amplification because of its low NF (Noise Figure), high PG (Power Gain) and low feedback capacitance.

The mixer is also a dual gate MOS FET. The reception signal is applied to gate 1 and the local oscillator signal is applied to gate 2. This circuit has low local oscillator signal injection power and the strong reception signal has little effect on the local oscillator.

The local oscillator is a modified Clapp circuit. Its output signal is injected into the mixer thru a J-FET buffer.

IF Amplifier

Four dual element ceramic filters are used as the selection elements, and one IC (TA7302P) containing two differential amplifiers and one FM IF IC (PA3001-A) are used as the amplification elements.

The TA7302P compensates for the filter insertion loss, and also limits the amplitude of the FM signal.

The PA3001-A performs IF amplification, amplitude limiting and FM detection. It also drives the TUNING and SIGNAL meters and controls muting.

The block diagram of the PA3001-A is given in Fig. 2.

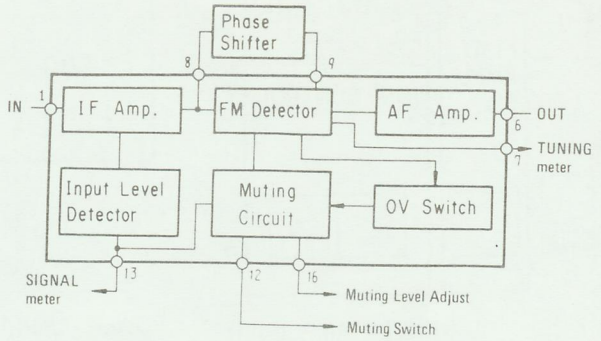

Fig. 2 Block diagram of PA3001-A

FM Multiplex Decoder

The FM multiplex decoder is a PLL (Phase-Locked-Loop) MPX IC (PA1001-A). Its block diagram is given in Fig. 3.

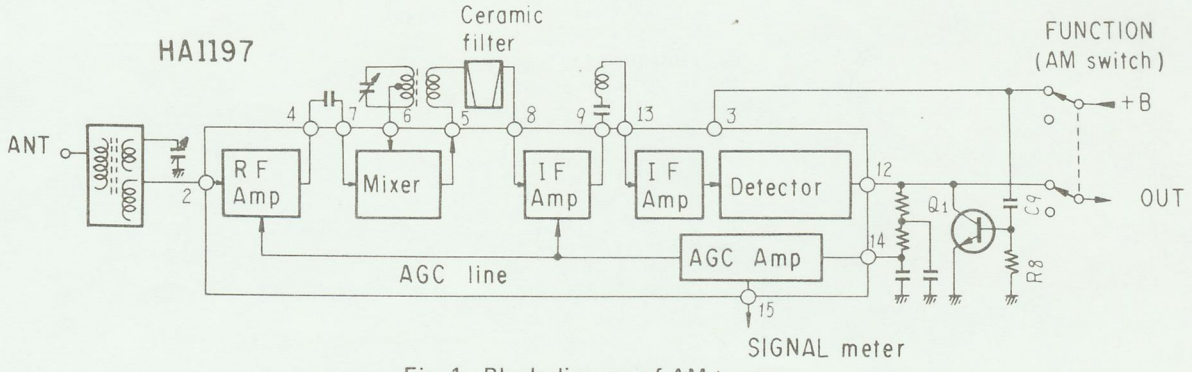

Fig. 1 Block diagram of AM tuner

PA1001-A contains a PLL VCO circuit, double-balance type differential demodulator with NFB amplifier, and pilot auto-cancel circuit to improve the distortion characteristics, frequency response, and S/N.

The nonlinear distortion produced at the demodulator has been improved by adding the NFB amplifier to the double-balance type differential demodulator.

The pilot auto-cancel circuit eliminates carrier leakage (19kHz), without a loss of demodulated signal frequency response.

Moreover, since the cancel signal level tracks the input pilot signal level, the rejection ratio does not drop even if the input pilot signal level changes.

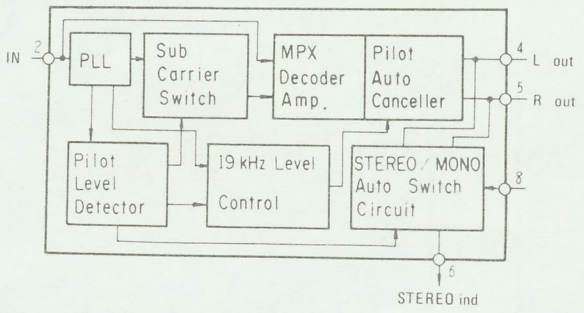

Fig. 3 Block diagram of PA1001-A

FM Output Amplifier

The FM output amp is an IC (PA1002-A). PA1002-A contains an AF amp. muting gate circuit and power ON/OFF muting control circuit. Its block diagram is given in Fig. 4.

The AF amp. is a differentially coupled NFB amp. featuring excellent dynamic range, S/N and distortion characteristics. A de-emphasis characteristic is obtained by providing a frequency selection characteristic at the NFB loop of this amp.

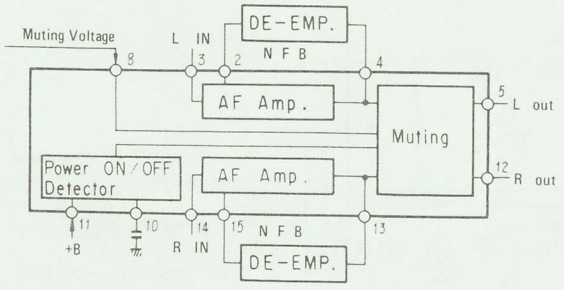

Fig. 4 Block diagram of PA1002-A

The muting circuit electronically grounds the signal circuit when a control voltage of 1.4V or greater has been applied to pin 8 of the PA1002-A. This control voltage is applied from pin 12 of the PA3001-A thru the MUTING switch. A 1.4V DC voltage is generated at pin 12 of the PA3001-A when de-tuned more than ±70kHz and at weak inputs (antenna input conversion 5μV or less).

6.2 AF SECTION

MIC Input Circuit

PHONO 2 is switched over to MIC when the microphone plug is inserted in to the MIC jack. This input circuit is equipped with an inverse RIAA curve designed to counteract the phono equalizer amplifier circuit.

PHONO 1 Input Capacitance Switching Circuit (Fig. 5)

The PHONO 1 input circuit includes an input capacitance switching stage which permits the user to select the optimum load capacitance for the phono cartridge being employed.

When C is excluded, the input capacitance of the circuit shown in Fig. 5 is 100pF. The capacitance of C may be set to either 0, 100, 200, or 300pF, thereby making the input load capacitance 100, 200, 300, or 400pF.

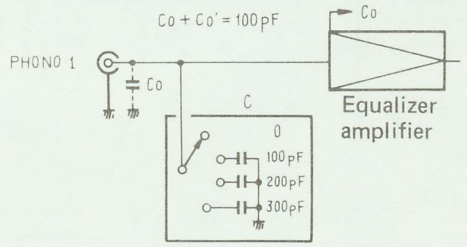

Fig. 5 PHONO 1 input capacitance switching circuit

Equalizer Amplifier

This is a 3-stage direct-coupled equalizer amplifier with a first-stage differential amplifier and final-stage pure complementary SEPP.

The role of the differential amplifier is to amplify the signal, and to stabilize the DC balance of the output neutral point. The bootstrap circuit in the second stage ensures sufficient gain to drive the final stage composed of a pure complementary SEPP circuit for a wide dynamic range and low output impedance. The RIAA equalization curve is produced by an NFB circuit employing 1%-error metal film resistors and 2%-error polypropylene capacitors, resulting in a equalization deviation of ±0.2dB (20Hz ~ 20kHz).

Flat Amplifier

The first stage of this 2-stage direct-coupled flat amplifier is equipped with a FET for higher input impedance. Ample NFB also permits an lower output impedance. As a result, there is little change in noise level when the VOLUME control resistance is altered, and there is also sufficient power to drive the NFB-type tone control circuits connected to the following stage:

NOTE:
Since the input impedance of the NFB tone control circuits is relatively low, there will be a certain amount of change when the variable resistor is rotated.

Tone Controls

The SX-1280 features two pairs of tone control circuits (twin tone controls), each with a different turnover frequency. The main tone controls are similar to other regular tone controls, while the sub tone controls permit variation of the frequency response at te very high and very low ends. Both main and sub tone controls apply C-B feedback to a single transistor amplifier, with frequency selection provided within the feedback loop, and the frequency response altered when these frequencies are changed.

All of these circuits may be by-passed by simply putting the TONE switch into the OFF position.

Filter Circuits

The filters employed in this receiver are −12dB/octave NFB-type active filters. By coupling the emitter-follower to RC passive filters, peaks have been obtained in the region of the cut-off frequencies, thereby sharpening the "knee characteristics" of the RC passive filters.

Power Amplifier (Fig. 6)

The first stage consists of a PNP dual transistor differential amplifier (Q_2) which loads the current mirror circuit (Q_3) to obtain high stable gain even in the high frequency range. The pre-driver stage (Q_4) operates with the constant current circuit (Q_5) as the load, amplifying the voltage to the required level. With a 3-stage Darlington connection in the power stage, and a parallel push-pull circuit in the final stage, a power output level of 185W + 185W/8Ω (20Hz ~ 20kHz, T.H.D. less than 0.03%) has been obtained.

The purpose of Q_1 is to equalize temperature changes in Q_2. By keeping the input base potential of Q_2 at a constant 0V, the Q_2 output neutral point potential will remain steady despite changes in temperature. Since this power amplifier is a DC amplifier, any DC voltages appearing at the Q_2 input base will be amplified and passed to the output. In order to avoid this, the drop in potential across R_1 due to the Q_2 input base current, is designed to be absorbed by the Q_1 base current, thereby maintaining the Q_2 input base potential constant at 0V.

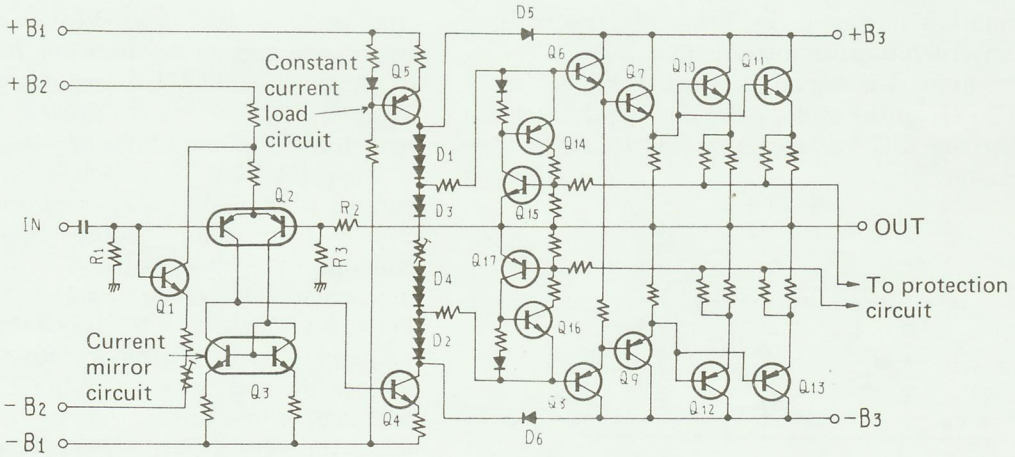

Fig. 6 Power amplifier circuit

Q_{14} to Q_{17} constitutes the power limiter stage. This stage measures the current flowing through the power transistors by means of the voltage produced by the power transistor emitter resistance. If the load impedance drops below 4 ohms, or the output level exceeds 180 watts, $Q_{14} \sim Q_{17}$ are activated, thereby limiting the drive voltage. Q_{14} and Q_{15} operate for positive half-cycles, and Q_{16} and Q_{17} for negative half-cycles.

D_1, D_2, D_5, and D_6 limit the drive voltage to prevent drive voltages in excess of a fixed level from being applied to the power stage, thereby avoiding clipping in the power stage, and the generation of oscillations.

NOTE:
If an excessively high drive voltage is applied to the power stage, the D_5 and D_6 anode peak voltage will exceed the power stage power supply voltage, thereby activating D_5 and D_6, and limiting the drive voltage.

Meter Amplifier (Figs 7, 8)

In order to indicate the 0.01W—400W range with one meter without range switching, a logarithmic indication type meter must be employed and the input signal must be logarithmically compressed. The meter amplifier circuit is shown in Fig. 7. This circuit consists of a logarithmic compression circuit and a meter drive circuit. The output signal of the power amplifier is applied to the logarithmic compression circuit, and its dynamic range is compressed. The principles of the logarithmic compression circuit are given in Fig. 8. The output voltage of this circuit is the value divided by R_{13} and Z. The attenuation at low signal input is reduced and the attenuation at large signal input is increased, by using the rise of the diode current-voltage characteristic at Z.

The compressed signal is shaped by D_5 and applied to Q_1 of the meter drive circuit. Q_1 current amplifies the DC voltage from D_5 to drive the power meter.

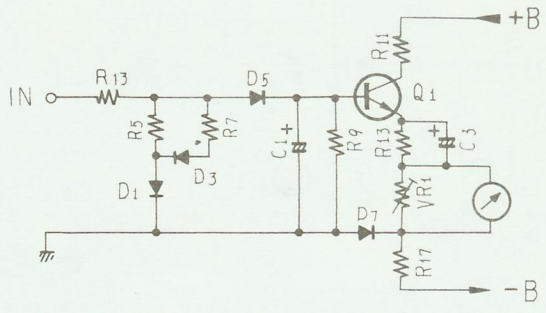

Fig. 7 Schematic diagram of meter amplifier

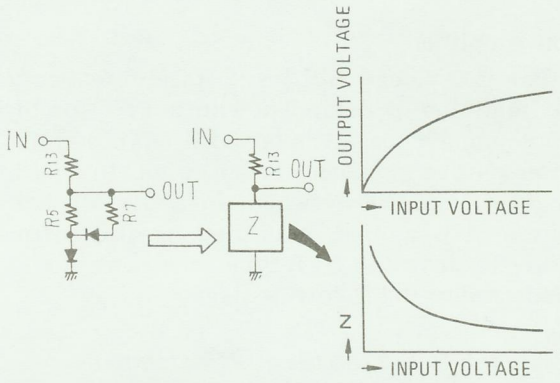

Fig. 8 Schematic diagram of logarithmic compressor

6.3 POWER SUPPLY CIRCUIT

The L and R channels in the power stage are both equipped with independent coils, bridge rectifiers, and a pair of 15000μF capacitors for independent supply of ±76V.

The class A amplifier circuits (equalizer amp, flat amp, tone control circuit, filter amp, first stage of the power amp, and the pre-driver stage) are supplied with ±68V and ±32V via a coil, bridge rectifier, and voltage regulator stage independent of the power stage.

The tuner section is supplied with +13.5V via lamp coils, voltage multiplier rectifier, and voltage regulator stage.

Surge Current Suppressor Circuit (Fig. 9)

The power supply stage in this equipment employs toroidal transformers of low internal resistance, and 4 high capacitance (15000μF) electrolytic capacitors for smoothing purposes. Therefore without any effective countermeasures, a sudden large surge of current would flow once the POWER switch was turned on, resulting in possible damage to fuses, the POWER switch itself, and other components. In order to prevent this, a surge current suppressor circuit has been incorporated.

When the POWER switch is turned ON, the AC current is applied to T (power transformer) via R_1 and the micro temp (thermal fuse). The secondary coil output in then rectified by diode D, resulting in capacitor C_1 being charged up, and relay R_L being activated. So until R_L is turned on, the voltage applied to the primary coil of T will be the voltage divided by R_1 and the T primary coil impedance, which means that the current flowing in when the POWER switch is first turned ON will be very small. The time required for R_L to be turned on will depend on the D and C_1 time constant Micro temp is a protection fuse designed to blow

upon detection of heat generated in R_1 if R_L should fail to turn on, or the T secondary coil fail to operate normally.

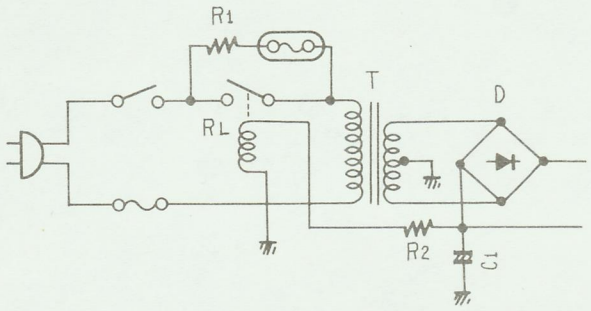

Fig. 9 Surge current suppressor circuit

6.4 PROTECTION CIRCUIT (Fig. 10)

The protection circuit featured in this equipment employs an IC (PA3004) recently developed by Pioneer. This IC includes DC voltage detection (a), +B voltage level detection (b), −B voltage level detection (c), AC voltage detection (d), C_T discharge switching (e), relay drive trigger switching (f), and constant current circuitry (g & h). This protection circuit is responsible for muting when the POWER switch is turned ON and OFF, speaker protection in case of an abnormal power amplifier neutral point potential, power amplifier protection in case of overloading, and speaker disconnection in case of protection circuit failure due to abnormal voltage in the power supply to the protection circuit IC.

POWER Switch Muting

The delaying action employed when the POWER switch is turned ON is determined by the time constants of the timing capacitor (C_T) and the constant current circuit (g). When the POWER switch is turned ON, +B is passed via (g) to charge up C_T. When fully charged, switch (f) will turn on, and a base current will flow from circuit (h) to Q_3, thereby turning the relay on.

When the POWER switch is turned OFF again, the AC voltage disappears immediately, resulting in switch (e) being turned on by the AC voltage detector (d), thereby discharging C_T. Consequently switch (f), Q_3, and the relay will all be turned off.

Abnormal Power Amplifier Neutral Point Potential

The occurrence of any abnormality in the power amplifier neutral point potential will be detected at (a), resulting in switch (e) being turned on. C_T will thus be charged up, and switch(f),Q_3, and the relay all turned off.

Protection Against Overload

If the bridge type detector circuit (Q_1) detects the presence of an overload condition, Q_2 will be charged on, resulting in a DC voltage being applied to detector (a). Switch (e) will thus turn on, and switch (f), Q_3, and the relay will all turn off.

Abnormal Protector Circuit Power Voltage

The power supply voltage level is detected by detectors (b) and (d). If the prescribed level is not attained, switch (e) will turn on, and switch (f), Q_3, and the relay all turn off.

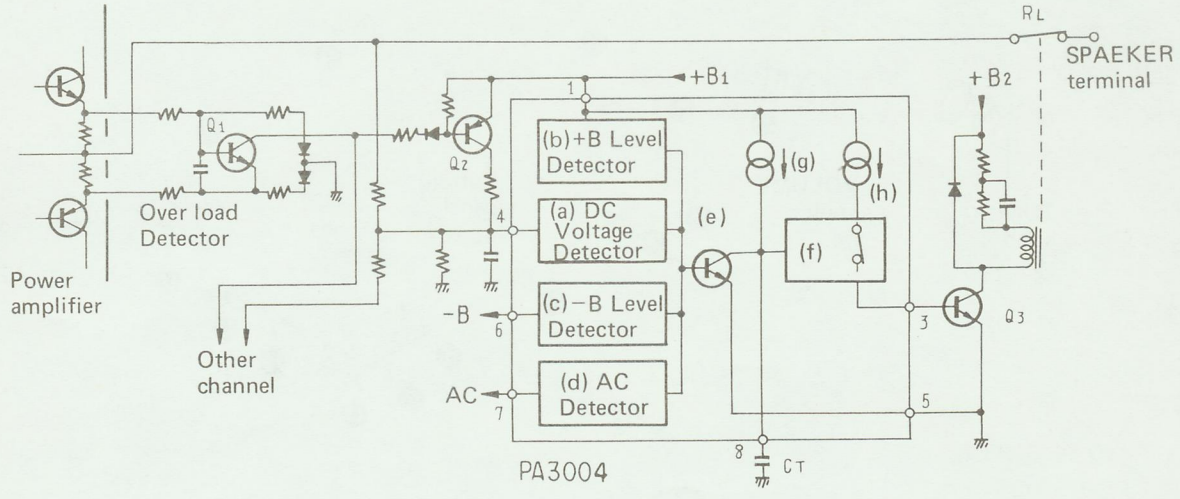

Fig. 10 Protection circuit

7. DISASSEMBLY

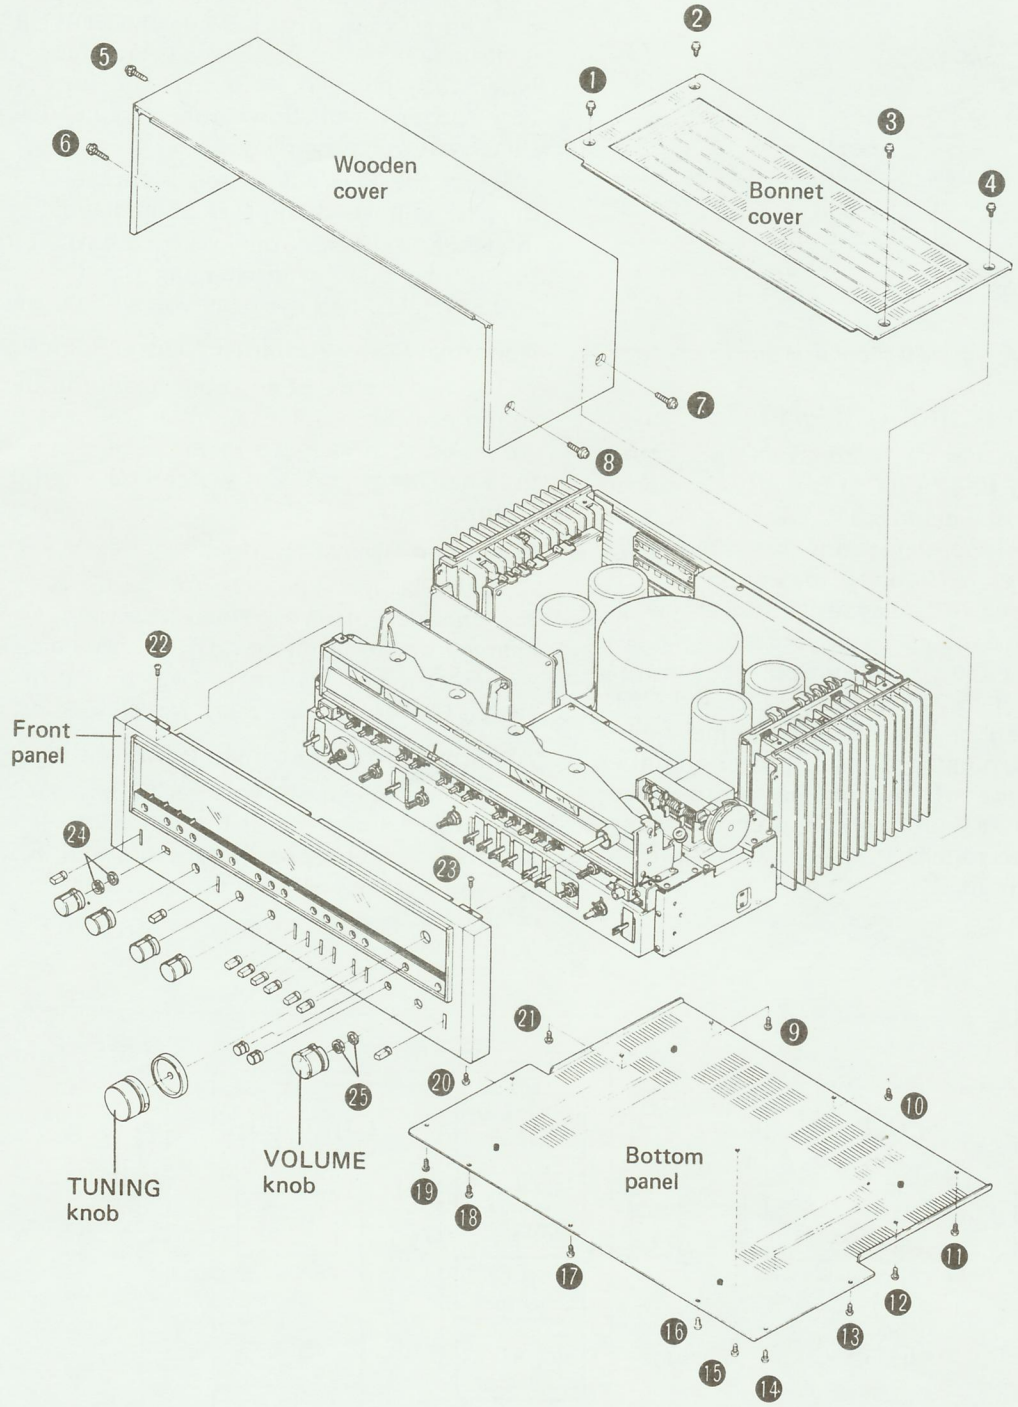

Fig. 11

Bonnet Cover

Remove the bonnet cover by undoing the 4 screws ❶ ~ ❹.

Wooden Cover

The wooden cover can only be removed after the bonnet cover has been removed. Undo the second set of 4 screws ❺ ~ ❽.

Bottom Plate

Undo 13 screws ❾ ~ ㉑ to remove the bottom plate.

Front Panel

To remove the front panel, first loosen the hexagonal screws in the VOLUME control and TUNING knobs, and then gently pull them off. All other front panel knobs are pulled off directly. Then undo the screws ㉒ and ㉓, and the pair of nuts and washers ㉔ and ㉕.

Power Amplifier and Heat Sinks (Fig. 12)

Undo the 4 screws ㉖ ~ ㉙ to remove the power amplifier and heat sinks.

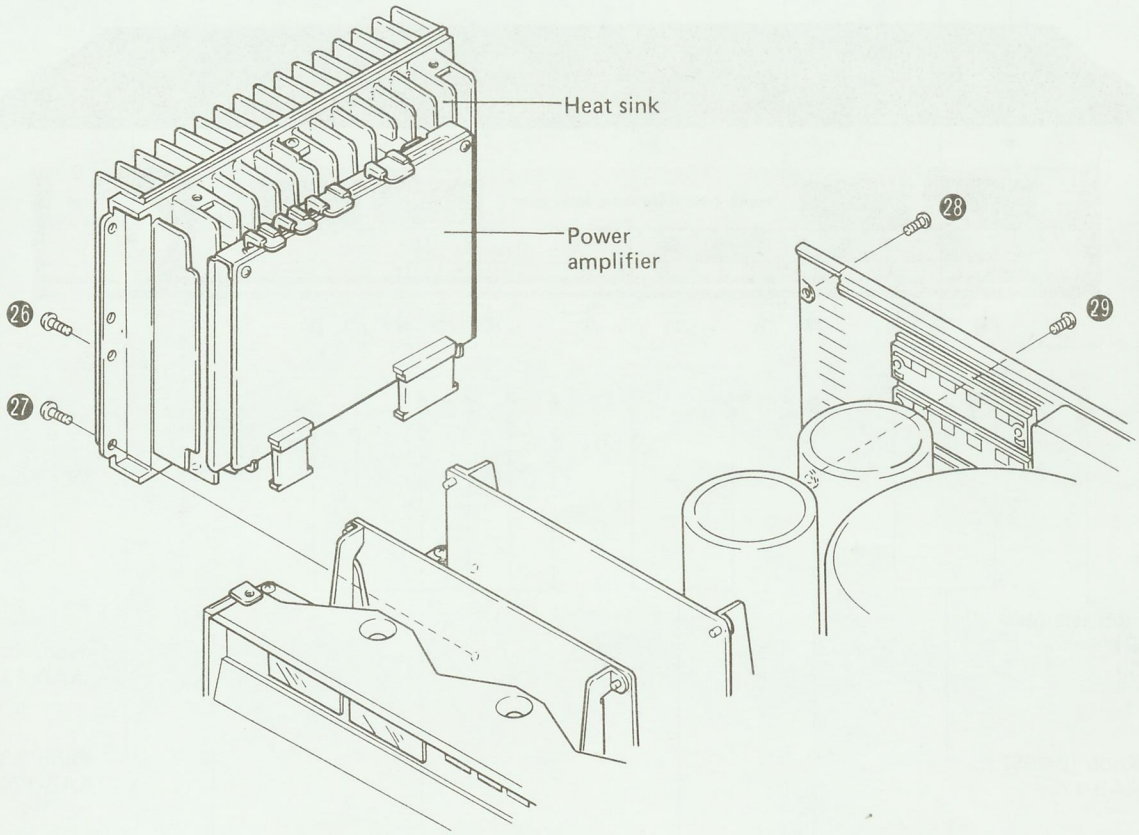

Fig. 12

9. DIAL CORD STRINGING

1. Remove the bonnet cover, wooden cover and front panel as described in the "Disassembly" section on page 18.
2. Undo the 3 screws ㉚ ~ ㉜ to remove the blind sash (Fig. 13).
3. Loosen screw ㉝, and then remove the tuning drum from the tuning capacitor shaft (Fig. 14).
4. Tie one end of the cord to the peg on the inside of the tuning drum (Fig. 14).
5. With the tuning capacitor blades turned full in, rotate the tuning drum around the variable capacitor shaft so that screw ㉝ is positioned at the apex (i.e. facing straight up).
6. Lead the cord out through the gap in the tuning drum, make half a turn, and then pass the cord over the pulleys A, B, and C in that order. Wind the cord 3 times around the tuning shaft and pass it over pulley D; then make 2 windings around the tuning drum, and finally tie it to the spring, making sure there is sufficient tension in the cord (Figs. 15, 16).
7. Turn the tuning shaft to check that the drum and cord move smoothly and easily, and then cut off the remaining cord.
8. Turn the tuning shaft right back in the counter-clockwise direction (so that the variable capacitor blades are fully intermeshed).
9. Align the dial pointer with the starter point on the dial scale, and secure it firmly to the cord (Fig. 17).
10. Finally apply the locking paint to the cord securing positions (tuning drum projection and spring) and the dial pointer connection.

10. ADJUSTMENTS

10.1 FM TUNER

FM Tracking

- Confirm that the dial is set to the start point.
- Connect as shown in Fig. 20, and set the FUNCTION switch to "FM" and the MUTING switch to "OFF".

1. Set an FM signal generator to 400Hz, 100% modulation, 100dB output.
2. Set TC_4 to near center capacitance, set the FM signal generator and the SX-1280 dial pointer to 90MHz, and adjust T_4 for maximum deflection at the signal meter.
3. Under the state of "2" above, adjust the primary (bottom) core of T_6 so that the pointer of the tuning meter deflects to the cetner of the scale.
4. Set the FM signal generator output to 9dB, and adjust T_1, T_2, T_3 for maximum output.
5. Set the FM signal generator and the SX-1280 dial pointer to 106MHz, and adjust TC_4 for maximum deflection at the signal meter.
6. Set the FM signal generator output to 9dB, and adjust TC_1, TC_2, TC_3 for maximum output.
7. Repeat steps 2—6 until reception at 90MHz and 106MHz is perfect. At this time, adjust T_5 for maximum output.
8. Adjust the primary core (bottom) of T_6 so that the pointer of the tuning meter deflects to the center of the scale in the untuned state (noise only).
9. Set the FM signal generator output to 60dB, set the SX-1280 dial pointer to 98MHz, and tune the FM signal generator at the tuning meter. (Pointer of tuning meter deflects to the center of the scale).
10. Adjust the secondary side (top) of T_6 for minimum distortion.
11. Repeat steps 8—10 until the minimum distortion point does not change.
12. Set the FM signal generator output to 100dB, and adjust VR_2 for maximum deflection at the signal meter (Fig. 18).
13. Set the FM signal generator output to 20dB. Set the MUTING switch to "ON" and adjust VR_1 so that the output waveform disappears.

MPX Decoder

- Connect as shown in Fig. 20, and set the FUNCTION switch to "FM" and the MUTING switch to "OFF".

1. Set the FM signal generator to 98MHz unmodulated, 60dB output.
2. Connect the output of the MPX SG PILOT OUT terminal to the horizontal axis input terminal of an oscilloscope and tuner ass'y terminal 13 to the vertical axis input.
3. Set the SX-1280 dial pointer to 98MHz and adjust the FM signal generator so that the tuning meter deflects to the center of the scale.
4. Adjust VR_3 so that a Lissajous pattern is traced on the oscilloscope (Fig. 19).
5. Modulate the MPX SG at L+R (1kHz) to deviate the 67.5kHz pilot signal (19kHz) 7.5kHz.
6. Adjust T_5 for minimum L channel or R channel distortion. (However, within ±90° of the core adjustment range).
7. Make the MPX SG main signal L or R and adjust VR_4 for best separation.
8. Next, set the MPX SG to 7.5kHz by pilot signal (19kHz).
9. Adjust VR_5 for minimum output.

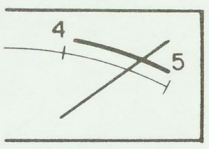

Fig. 18 Meter deflection

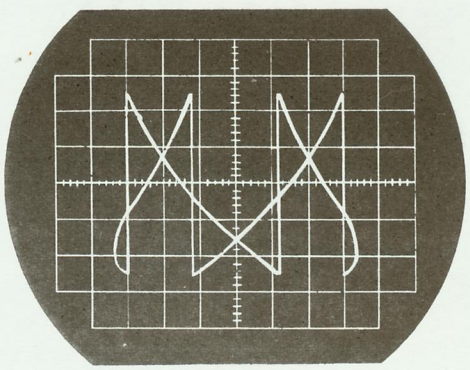

Fig. 19 Lissajous waveform

10.2 AM TUNER

1. Connect the AM signal generator (AMSG) to the AM ANTENNA terminal via a 1kΩ resistor (Fig. 21).
2. Turn the AM function switch ON.
3. Turn the DUPLICATE switch OFF, and connect an AC voltmeter to either the L or R TAPE 1 REC jack.
4. Apply a 400Hz, 30% modulated signal to AMSG, and set the output to 100dB.
5. Adjust the tuning dial indicator and AMSG frequency to 600kHz.
6. Adjust the T_7 core to provide maximum reading in the AC voltmeter.
7. Next readjust the tuning dial indicator and AMSG frequency to 1400kHz.
8. Adjust TC_6 (trimmer) to again provide maximum reading in the AC voltmeter.
9. Set AMSG to 30dB output level.
10. Return the tuning dial indicator and AMSG frequency to 600kHz.
11. This time adjust bar antenna core to provide maximum reading in the AC voltmeter.
12. Return the tuning dial indicator and AMSG frequency back to 1400kHz.
13. Adjust TC_5 (trimmers) to again provide maximum reading in the AC voltmeter.
14. Repeat steps 10 to 13 above until no further changes occur in the AC voltage reading at the 600kHz and 1400kHz positions.

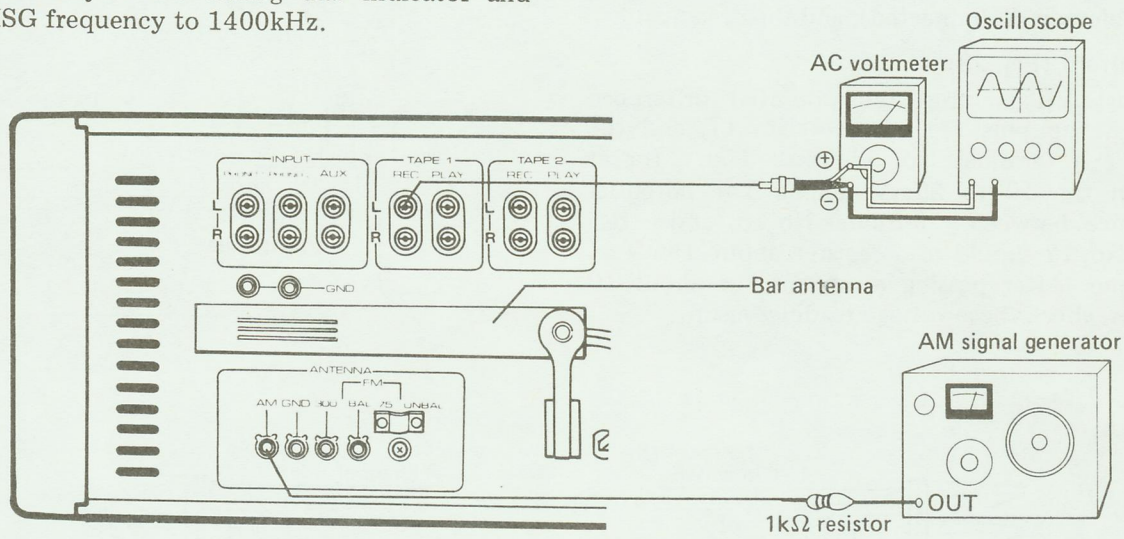

Fig. 21

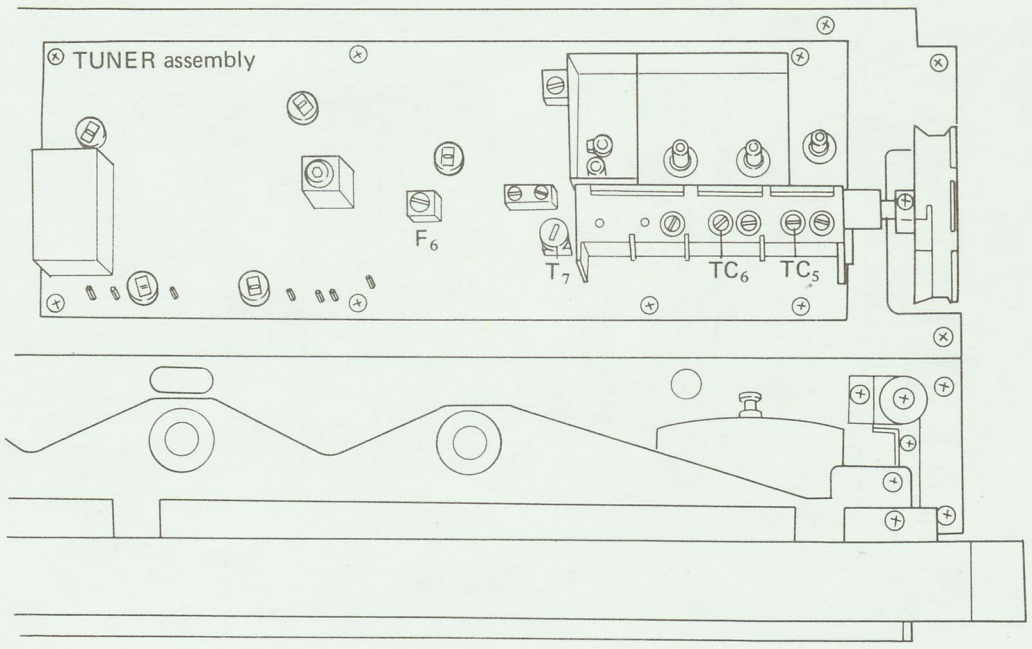

Fig. 22

10.3 POWER AMPLIFIER

Turn VR_2 (L and R) fully around in the counter-clockwise direction, but set VR_1 (L and R) to the center positions. Without any load or input signal, turn the POWER switch ON.

Since the same configuration is used for both left and right channels of the SX-1280 power amplifier assembly, the following adjustments apply to both channels.

DC Balance (Fig. 23)

Adjust VR_1 so that the potential differnence between terminals No. 14 and ground reads zero volts (to within ±20mV). If this level cannot be attained, disconnect the jumper leads A (or reconnect if already disconnected), and then readjust.

Idle Current (Fig. 23)

Adjust VR_2 so that the potential differnece between the plus (+) terminal No. 17, and the minus (−) terminal No. 11 reads 15mV (or at least in the 10 to 25mV range). The potential difference between + terminal No.18, and − terminal No. 12 should also register about 15mV at this time. After passing a current for about 10 minutes, check these voltage readings again.

10.4 METER AMPLIFIER

Apply a 1kHz signal to the POWER AMP IN terminals (or any other power amplifier input terminals). Adjust the level of this input signal so that the voltage on the output terminals (SPEAKERS) reads 37.95V rms (AC). Then adjust VR_2(L) and VR_1(R) of the meter amplifier assembly so that the output power meters read 180 watts.

Parts List of Tuner Assembly (AWE-092)

TRANSFORMER, COILS AND FILTERS

Symbol	Part No.	Description
T1	ATC-021	FM antenna coil
T2	ATC-015	FM RF coil
T3	ATC-016	FM RF coil
T4	ATC-057	FM RF coil
T5	ATE-039	FM matching coil
T6	ATE-030	FM detector transformer
T7	ATB-013	AM OSC coil
F1	ATF-018	FM ceramic filter
F2	ATF-018	FM ceramic filter
F3	ATF-018	FM ceramic filter
F4	ATF-018	FM ceramic filter
F5	ATF-047	Low pass filter
F6	ATF-038	455kHz filter
F7	ATF-034	AM ceramic filter
L1	T24-028	RF choke coil
L2	T24-028	RF choke coil
L3	ATH-014	Micro inductor
L4	T24-028	RF choke coil
L5	T24-028	RF choke coil

CAPACITORS

Symbol	Part No.	Description		
VC	ACK-022	Variable capacitor		
TC4	ACM-006	Ceramic trimmer		
C1	CCDTH 150K 50	Ceramic	15p	50V
C2	CCDSL 101K 50	Ceramic	100p	50V
C3	CKDYF 103Z 50	Ceramic	0.01	50V
C4	CCDSL 020C 50	Ceramic	2p	50V

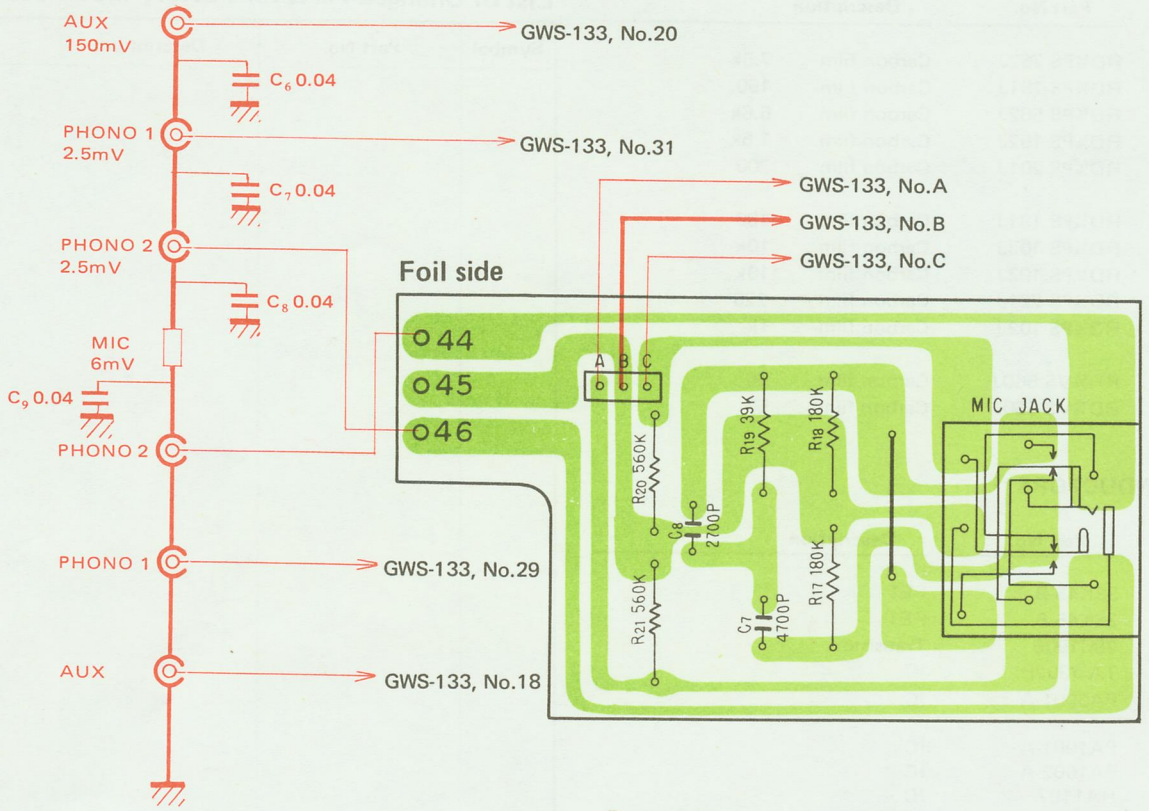
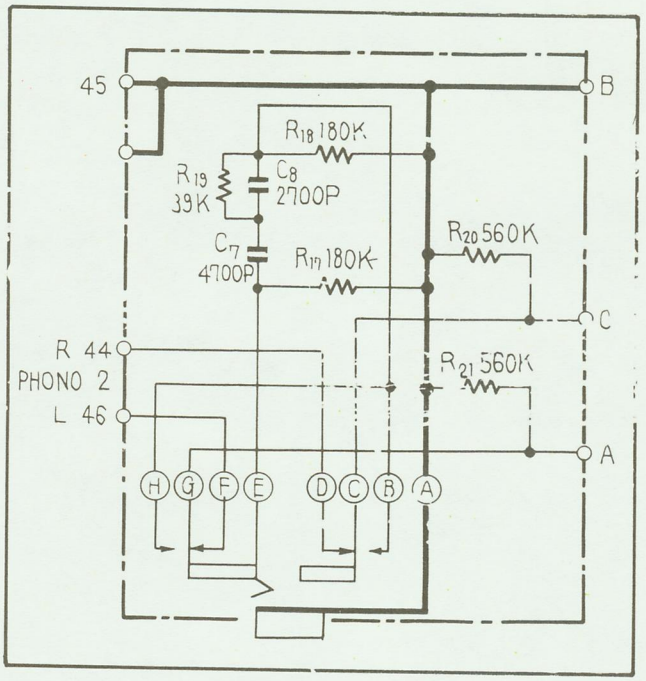
List of Changed Parts for Factory Modification

Symbol	Part No.	Description

13.3 MICROPHONE JACK ASSEMBLY (GWM-105)





Parts List

CAPACITORS

Symbol	Part No.	Description		
C7	CKDYA 472J 50	Ceramic	4700p	50V
	(CQMA 472J 50)	(Mylar)	(4700p	50V)
C8	CKDYA 272J 50	Ceramic	2700p	50V
	(CQMA 272J 50)	(Mylar)	(2700p	50V)

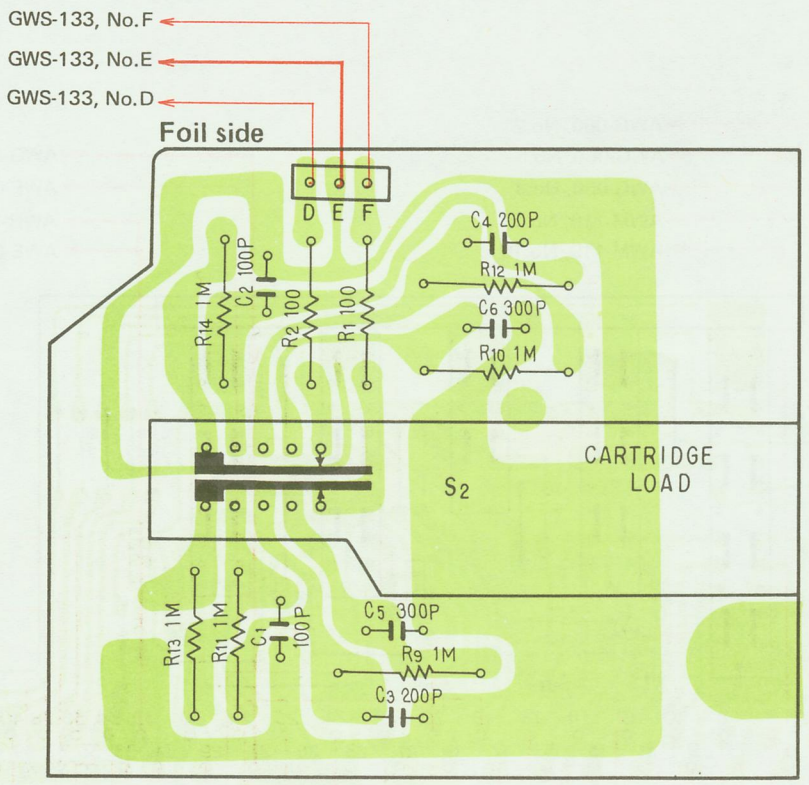
RESISTORS

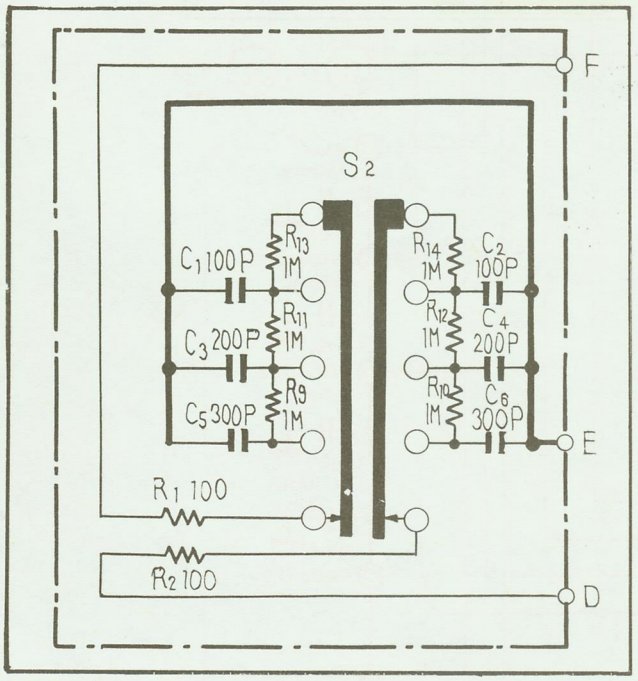
Symbol	Part No.	Description	
R17	RD¼PS 184J	Carbon film	180k
R18	RD¼PS 184J	Carbon film	180k
R19	RD¼PS 393J	Carbon film	39k
R20	RD¼PS 564J	Carbon film	560k
R21	RD¼PS 564J	Carbon film	560k

OTHER

Symbol	Part No.	Description
	AKN-012	Phone Jack (MIC)

13.4 CARTRIDGE LOAD ASSEMBLY (GWS-134)





Parts List

SWITCH

Symbol	Part No.	Description
S2	ASE-001	Rotary switch (CARTRIDGE LOAD)

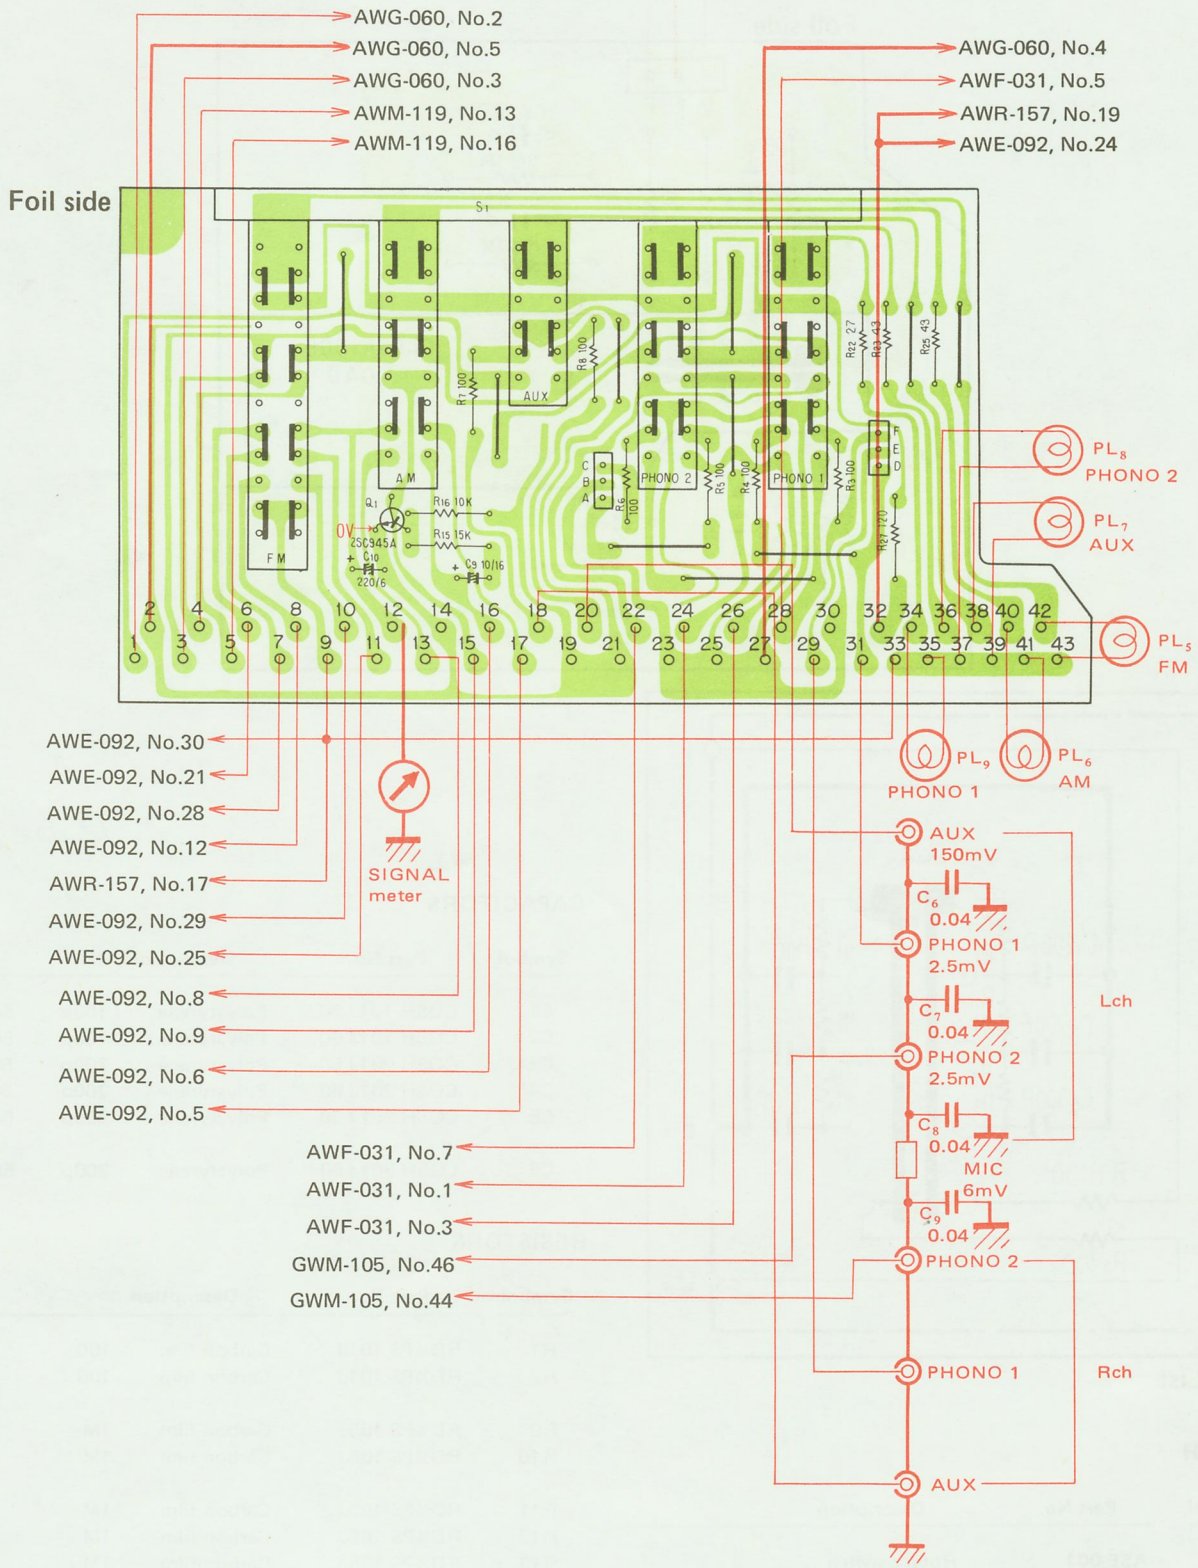
CAPACITORS

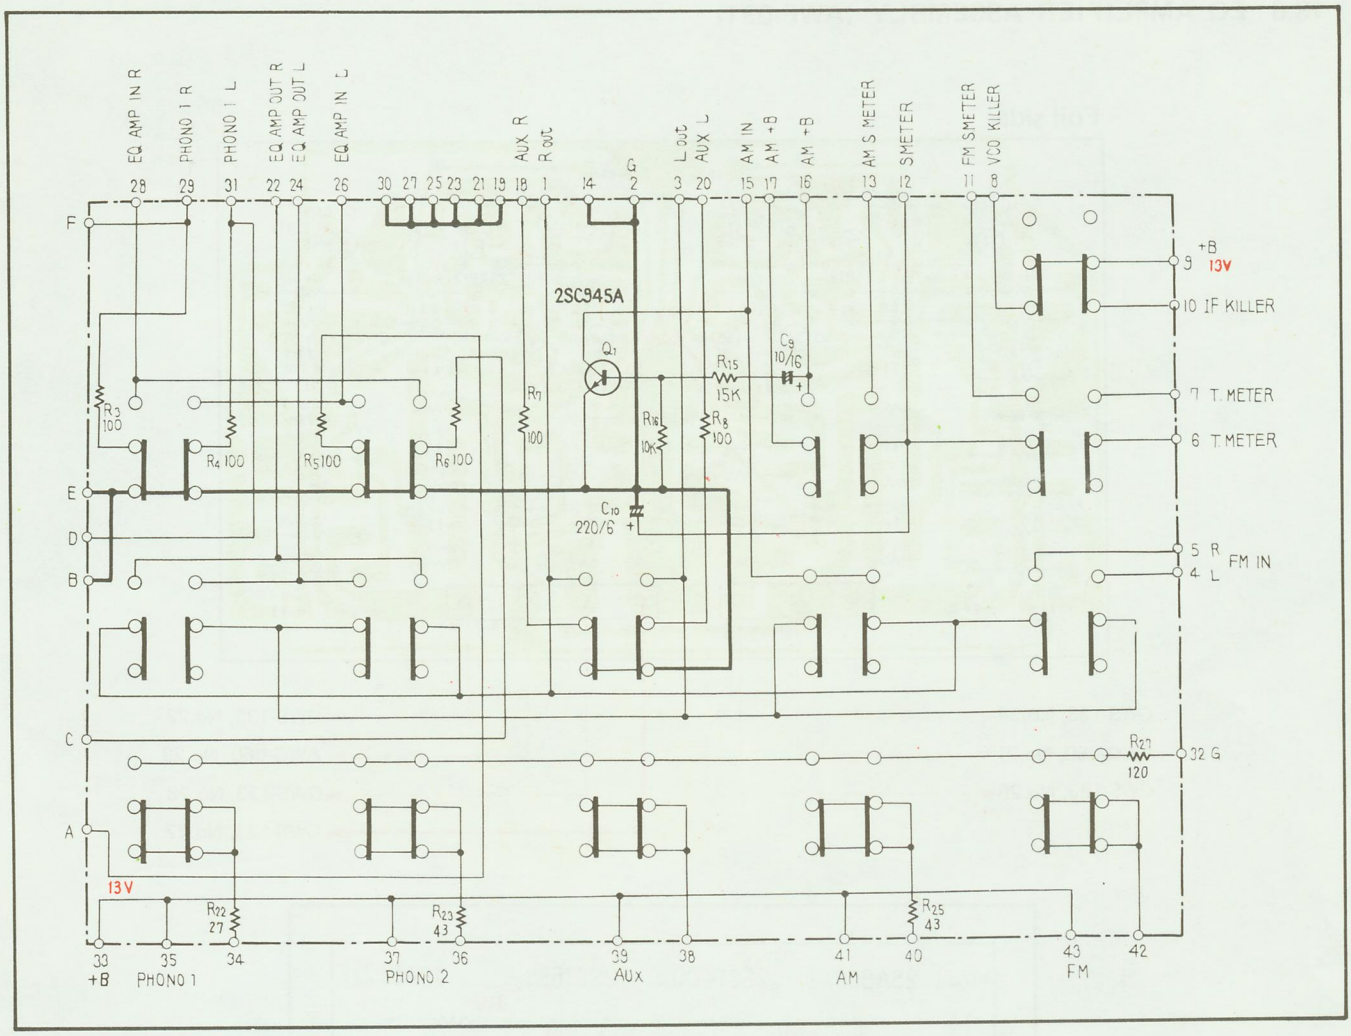
Symbol	Part No.	Description		
C1	CQSH 101J 50	Polystyrene	100p	50V
C2	CQSH 101J 50	Polystyrene	100p	50V
C3	CQSH 201J 50	Polystyrene	200p	50V
C4	CQSH 201J 50	Polystyrene	200p	50V
C5	CQSH 301J 50	Polystyrene	300p	50V
C6	CQSH 301J 50	Polystyrene	300p	50V

RESISTORS

Symbol	Part No.	Description	
R1	RD¼PS 101J	Carbon film	100
R2	RD¼PS 101J	Carbon film	100
R9	RD¼PS 105J	Carbon film	1M
R10	RD¼PS 105J	Carbon film	1M
R11	RD¼PS 105J	Carbon film	1M
R12	RD¼PS 105J	Carbon film	1M
R13	RD¼PS 105J	Carbon film	1M
R14	RD¼PS 105J	Carbon film	1M

13.5 FUNCTION SWITCH ASSEMBLY (GWS-133)





Parts List of Function Switch Assembly (GWS-173)

SWITCH

Symbol	Part No.	Description
S1	ASG-126	Push switch (FUNCTION)

CAPACITORS

Symbol	Part No.	Description		
C9	CEA 100P 16	Electrolytic	10	16V
C10	CEA 221P 6	Electrolytic	220	6V

RESISTORS

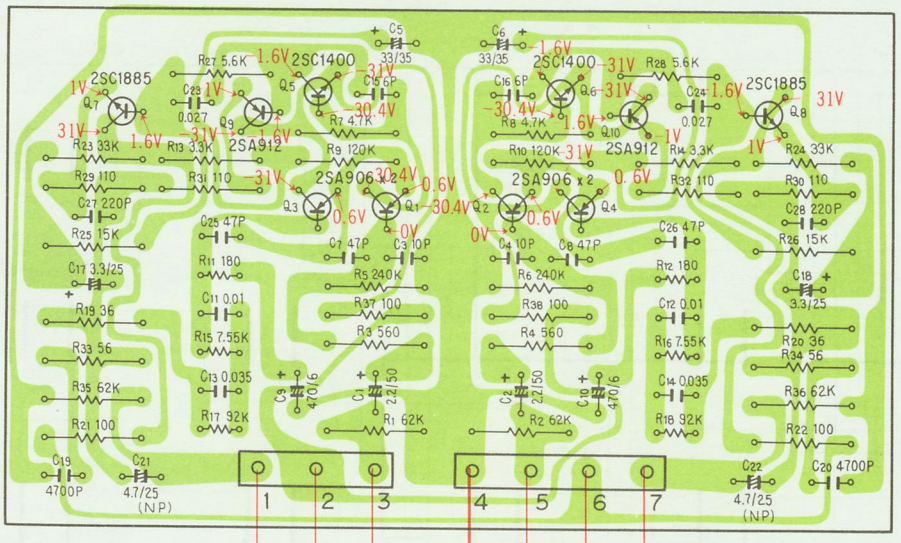
Symbol	Part No.	Description		
R3	RD¼PS 101J	Carbon film	100	
R4	RD¼PS 101J	Carbon film	100	
R5	RD¼PS 101J	Carbon film	100	
R6	RD¼PS 101J	Carbon film	100	
R7	RD¼PS 101J	Carbon film	100	
R8	RD¼PS 101J	Carbon film	100	
R15	RD¼PS 153J	Carbon film	15k	
R16	RD¼PS 103J	Carbon film	10k	
R22	RD¼PS 270J	Carbon film	27	
R23	RD¼PS 430J	Carbon film	43	
R25	RD¼PS 430J	Carbon film	43	
R27	RD½PS 121J	Carbon film	120	½W

SEMICONDUCTOR

Symbol	Part No.	Description
Q1	2SC945A-Q or R	Transistor

13.6 EQ AMPLIFIER ASSEMBLY (AWF-031)

Foil side



GWS-133, No.24

AWG-060, No.21

GWS-133, No.26

GWS-133, No.22

AWG-060, No.23

GWS-133, No.28

GWS-133, No.27

ADDITIONAL

Service Manual

PIONEER

AM/FM STEREO RECEIVER

SX-1280 S S/G

- This additional service manual provides the description of the parts applied only S, and S/G types.
- For detailed instructions on adjustments, circuit descriptions, exploded views, etc., please refer to this Service Manual (page 3 ~ page 80).

1. SPECIFICATIONS

Preamplifier Section

Input (Sensitivity/Impedance)
TAPE PLAY 2 (DIN connector). . . . 150mV/50kilohms
Output Level/Impedance
TAPE 2 (DIN connector) 30mV/80kilohms

Miscellaneous

Power requirements . . . . . 110V, 120V, 220V, 240V switchable, 50/60Hz
Power Consumption . . . . . .1100W (max.)

Furnished Parts

Fuse 6A 1
Fuse 12A. 1

2. CONTRAST OF MISCELLANEOUS PARTS

NOTE:
- *Capacitors: in μF unless otherwise noted p:pF*
- *Resistors: in Ω, ¼W unless otherwise noted k:kΩ, M:MΩ*
